- 4.1 email template**
- 4.2 Triggering statuses**

5.Change logs

- 5.1 Version 2.0.0**
- 5.2 Version 2.1.6**

1.Settings

1.2 Definition of orders to track

To avoid having a large and irrelevant order list, you must restrict this list to a minimum order date and to certain statuses, such as "shipped" status.

1.2 Update of order statuses

By default, the module does not update the order statuses because we believe that the tracking statuses relate to the actions carried out by the carriers and that they should not impact the order statuses specific to merchants. However, if you need to change your order statuses according to the tracking statuses, such as changing the status from "preparation in progress" to "shipped", or from "shipped" to "delivered", it is possible thanks to the correspondence grid for follow-up statuses with order statuses.

2.Tracking of orders

2.1 Connectors

The module contains connectors, 1 per carrier's API, which each communicate by following the API protocol of the carrier, and which provides the module with a response according to a unique structure. To use a connector, you must first press the install button, and if it requires credentials, you have to enter them by clicking on the "details" button

2.2 Mapping of connectors with carriers

Once the connector is installed, you should link it to the carrier. To do this, go to the tracking interface, then in the grid that displays your shipped orders, in the "Connector" column select the connector corresponding to the carrier. The change of a connector for a carrier will cause the change on all other current and future orders, thanks to a carrier / connector matching table.

2.3 Tracking interface

The tracking interface is accessible via the menu orders / tracking center.

It presents the list of all orders with a minimum date and a status as defined in the configuration page.

On each order row, a "Track" button is used to launch the webservice call to the transporter tracking API and to receive the response, which will give rise to a tracking status specific to the module as well as a date of event.

A "Track All" button allows you to track all the orders displayed and selected.

2.4 Tracking by cron task

You can also track by cron task, which reproduces the same tracking as the mass tracking mentioned above. To do this, use the cron task url in your cron task manager.

2.5 Tracking monitoring

There are several ways to view delivery tracking:
tracking interface provides you with the latest status
the "History" menu located on the orders rows, provides you with a monitoring summary, as well as a history of webservice calls and sent emails.
A tracking block is displayed on the order page and displays the same content as that mentioned above.

3. Inform Customers

This feature is very useful for informing your customers, especially for statuses shipped, in transit, delivered at a relay point or even at home. This avoids customer concerns and solicitations.

3.1 Email template

You can view and test the email template via the email tab on the configuration page.

3.2 Shipment linked to tracking

Emails of which sent to customers during order follow-up, whether done via the individual follow-up button, in sit or by cron task, and according to the statuses that you have selected in the configuration page

3.3 Manual transmission

You can also send an email, without it being triggered by the follow-up, for this use the button "send an email" located in the submenu of the button "Follow" or "Follow all"

3.4 Front office information page

When your customers receive the follow-up email, a "Follow on site" button invites them to view the follow-up on a dedicated page, on your site and takes up the content of the email, this will be an opportunity to return the client on your site.

3.5 information page in the customer area

Your customers can also see the delivery tracking in their customer area. A tracking table, identical to the one displayed in the email and in the tracking page, is displayed when the customer selects an order.

4. Inform administrators

This function is useful for identifying possible errors due to incorrect tracking numbers, a wrong password, an API out of service, ...

4.1 Email template

The email template is the same as the one sent to customers, except that it contains all tracking statuses, including error statuses, while the one sent to customers only mentions valid statuses.

4.2 Triggering statuses

The sending of emails to the administrators is triggered according to the monitoring statuses as defined in the configuration page, only during the tracking done via cron task.

A field allows you to enter a list of emails to receive these notifications.

5. Change logs

5.1 Version 2.0.0
5.2 Version 2.1.6
