

Easy Import/Export Products Module

This module allows you to easily import and bulk update products and product combinations with just a few clicks from CSV, EXCEL, XML, JSON, TXT files. You can automate this process by using CRON Job and configuring it to get your import file from specific location i.e. URL (HTTPS, HTTP), FTP or File Path.

Installation

1. On the modules page, click on "Add a new module" button.
2. Choose the module file and click on "Upload this module".
3. If the installation is successful, you will see a success message.
4. The module will then appear in your list of modules under Modules List.
5. Click on "Install" button to install the module.
6. If configuration note appears, click on "Configure" button to configure it.

The benefits for merchants

- ✓ Easily import product data from CSV/EXCEL/XML/JSON/TXT files.
- ✓ Just upload your import file and match columns with the right product properties and enjoy flawless bulk import of product data.
- ✓ You can also import product combinations.
- ✓ Regardless of the size of your import file, the module will import all data without any issues.
- ✓ Server timeout problem is resolved by using AJAX and importing data in portions.
- ✓ You can configure CRON Job to import data from any accessible location.
- ✓ You can update products by Reference as well as ID.
- ✓ The module provides many options to configure it and import products as you want.
- ✓ You can see progress of import by CRON Job right in the module page.

STEP 1: FILE UPLOAD

Upload import file from your computer. If you want to setup CRON Job to automatically import product data, specify URL or FTP access or full path to the file if it is located on the same server. When you start a new import, you will have a list of options to select for your import. These settings are saved so that you will not have to select them every time you want to import. Below you can find descriptions of each option:

- **Name.** It is for your reference only. You can give any name so that you can recognize it later.
- **Import Entity.** Here you can select whether you want to import products or combinations.
- **Import Method.** Besides importing by file upload, you have other options:
 - File Upload.** You will browse for your file on your computer and upload it.
 - File Path.** You will enter absolute path to the file on your server. For example: `/home/www/example/filename.csv` NOTE: You can use this method only if your file is located on the same server as your shop.
 - File From URL.** You will enter HTTP or HTTPS URL to your file. For example: <http://example.com/filename.csv>
 - File From FTP.** You will fill in FTP access details such as host, username, password and file name.
- **Create CRON Job.** If you want this import to be handled by CRON job, you can enable it with this option. CRON job will be enabled for this import so that you can automate importing from specified location at scheduled time.
- **Update products by.** Select to overwrite products by Reference or ID.
- **Language.** You can select a language to use for the import. Multilingual properties of products will be imported in this selected language.
- **Base URL/PATH for product images.** Here you can enter base URL for product images. e.g. `http://example.com/images/csv/` OR full path e.g. `/www/example/public_html/images/` If your image in file is `filename.jpg`, the module will take it from `http://example.com/images/csv/filename.jpg`
- **Multiple value separator.** Select a character used as delimiter for list type values. E.g., image list separator: `| image1.jpg|image2.jpg|image3.jpg`
- **Price decimal mark.** Select a decimal mark used in your import file for the product price. A decimal mark is a symbol used to separate the integer part from the fractional part of the product price.

- **Shipping package size unit.** Select whether your shipping package size unit is cm or m in your import file.
- **Shipping package weight unit.** Select whether your shipping package weight unit is kg or g in your import file.
- **Create new products.** If you enable this option, new products will be created. If you are importing only to update existing products, you may disable this option.
- **Enable new products by default.** New products will be enabled by default, if ENABLED column is not selected in mapping.
- **Delete old images.** If you enable this option, old images of products will be deleted before importing new ones.
- **Delete old features.** If you enable this option, old features of products will be deleted before importing new ones.
- **Replicate all languages.** If you enable this option, multilingual properties of products will be replicated to all languages. For example, if you are importing data and selected English for Language option, and you have French language added in your shop, then enabling this option will import English data to French language too.
- **Enable UTF-8 encoding.** Encodes an ISO-8859-1 string to UTF-8. You need to enable this option if your file is ISO-8859-1 encoded.

STEP 2: MAPPING

Match the columns of import file with related product properties. You can choose to ignore a column if you want to skip its data. The first row of your import file is usually a header which displays column names. If it is different in your case, you can select header row on this page at the top-right corner.

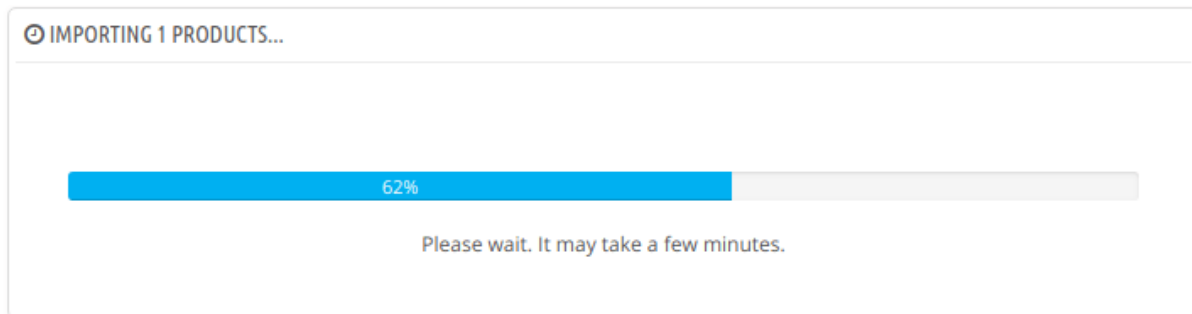

1 FILE UPLOAD 2 MAPPING 3 IMPORT

STEP 2: MATCH PRODUCT PROPERTIES WITH CSV COLUMNS HEADER ROW: - 1 +

REFERENCE	product_id
NAME	product_name
QUANTITY	Ignore this column
UNIT PRICE	

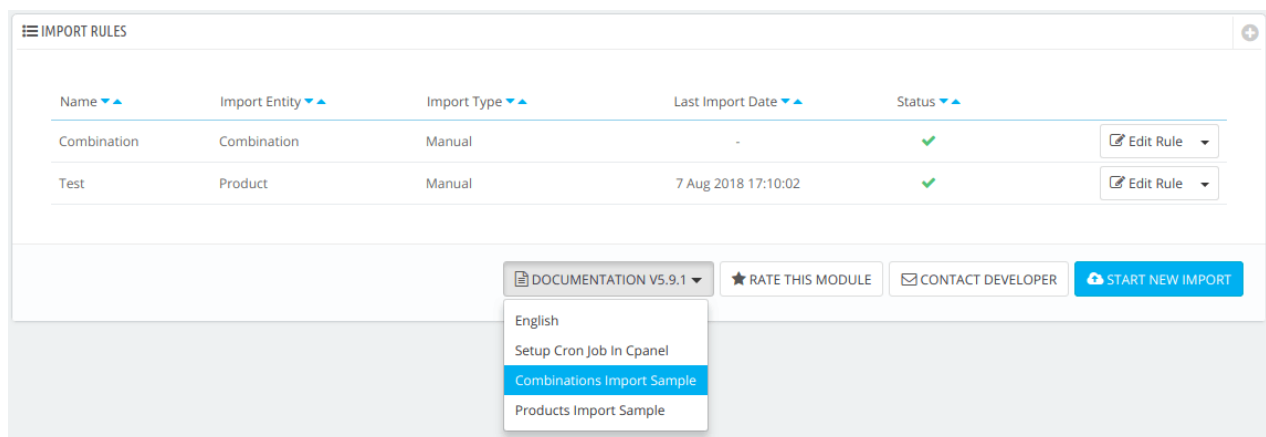

STEP 3: IMPORT

After you finish mapping columns, you can start importing. It may take a few minutes to finish the process, depending on how large your import file is. Data is imported in portions so you will not have server timeout issue.

Sample CSV files

You can find sample CSV files for importing products and combinations right in the module's main page under Documentation menu:

Features

- ✓ Easy to use.
- ✓ Allows importing products.
- ✓ Allows importing combinations.
- ✓ Allows exporting products to CSV file.
- ✓ Supports CSV, EXCEL, XML, JSON, TXT file formats.
- ✓ Supports import by file upload.
- ✓ Supports import by URL (HTTPS, HTTP).
- ✓ Supports import by FTP.
- ✓ Supports import from file path.
- ✓ Automated import with CRON Job.
- ✓ Automates time-consuming process.
- ✓ Multishop support.
- ✓ Multilang support.
- ✓ Premium technical support.

Recommendations

Please visit developer's modules page for other amazing modules:
